

Assignment: GCC Installation and First C Program

1. Install GCC and Verify Installation

After installing GCC, open Command Prompt (Windows) or Terminal (Linux/Mac) and run the following command:

```
gcc --version
```

Example Output:

```
gcc (GCC) 14.2.0  
Copyright (C) Free Software Foundation, Inc.
```

This output confirms that GCC has been installed successfully.

2. Create a New File Named hello.c

Create a new file named hello.c and write the following C program:

```
// Header File  
  
#include <stdio.h>  
  
  
// Main Function  
  
int main()  
{  
    printf("Hello, Instagram World!\n");  
  
    // Return Statement  
    return 0;  
}
```

3. Identify and Label the Program Components

Header File:

```
#include <stdio.h>
```

Main Function:

```
int main()
{
    ...
}
```

Return Statement:

```
return 0;
```

4. Compile and Run the Program

Compile the program using the GCC compiler:

```
gcc hello.c -o hello
```

Run the program:

For Windows:

```
hello.exe
```

For Linux/Mac:

```
./hello
```

Expected Output:

```
Hello, Instagram World!
```

Conclusion

The GCC compiler was installed and verified successfully. A C program named hello.c was created, compiled, and executed. The program displayed the message "Hello, Instagram World!" on the screen.
